

Final Product Requirements Document (PRD)

Employee Dashboard – Frontend Take-Home Assignment

Objective

Build a polished, production-quality Employee Dashboard that fulfills all assignment requirements with exceptional UI/UX, clean architecture, reusable components, accessibility, maintainable code, and one AI-powered feature.

Technology Stack

Vite, React, TypeScript (preferred), Tailwind CSS (or equivalent), React Router, Local JSON / Mock Data, Recharts, Framer Motion, Lucide React.

Required Features

Attendance Dashboard, Leave Summary, Leave Request Form, Team Directory with Search & Filter, Company Announcements, AI Announcement Summarizer.

Bonus Features

Light Theme, Dark Theme, Charts, Calendar, Profile Page, Loading States, Toast Notifications, Smooth Micro-interactions and Premium Animations.

Engineering Standards

Follow a feature-based folder structure, build reusable components, maintain consistent naming, write clean and maintainable code, avoid duplication, implement loading/error/empty states, and keep the codebase modular and easy to understand.

Phase Scope

Phase 1 is desktop-only. Do NOT implement responsiveness in this phase. Mobile and tablet responsiveness will be completed separately during Phase 2.

Themes

Implement both Light and Dark themes with equal attention to quality. Light theme is the default. Dark theme must be purposefully designed, not simply color-inverted. Persist theme selection using localStorage.

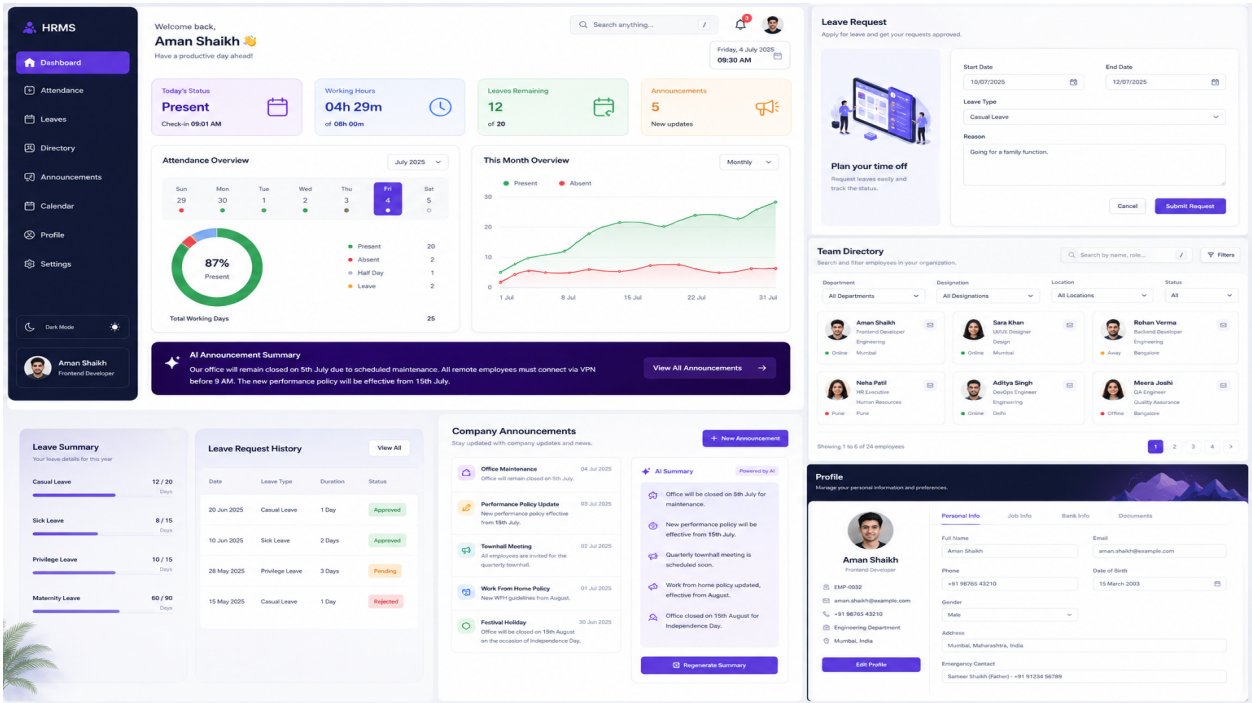

Code Quality

Write naturally structured, professional, maintainable frontend code with clear architecture, meaningful naming, logical component decomposition, and consistent organization.

Submission

Include a .gitignore file, README with setup instructions, architecture overview, AI tools used, assumptions, trade-offs, GitHub repository, and deployed application.
